The Internet is one of the most powerful educational tools. With developments made in technology, a more enriching educational experience has been made possible for teachers and students alike. Nowadays, almost all high school students have access to personal computers and the Internet, and rely on them heavily to complete assignments and projects. In addition, I am one of the users of it.

The availability of online resources has allowed studentss to assign homework, to find more facts quicker. Tim Berners-Lee fonded International network, called Inernet in 1969. “Twenty years ago this month, a software consultant named Tim Berners-Lee at the European Organization for Nuclear Research (better known as CERN) hatched a plan for an open computer network to keep track of research at the particle physics laboratory in the suburbs of Geneva, Switzerland. Berners-Lee’s modestly titled “Information Management: A Proposal,” which he submitted to get a CERN grant, would become the blueprint for the World Wide Web” [1].

In the science of language, there is a new branch, which is called Internet linguistics. D. Crystal defines Internet linguistics as the analysis of language activity in all spheres of the Internet network. According to him, this includes e-mails, various types of chats, games, web pages, and partly computer-based communication, for example, SMS-data. The Internet is gradually becoming a multilingual communicative environment [2].

It is an amazing resource not only for students, each person; either adults or young use it nowadays. With a few clicks, you can find articles, primary sources; students can find answers to almost any question and more to help you write that research paper. No more trips to the library! This ease of access to information has made research much easier and more efficient. In addition, online resources such as educational videos and articles can supplement classroom learning, making the learning process more engaging and effective

The internet has become ubiquitous in our lives, with many adults spending at least a part of their day online. For those of us who have not yet graduated from

college, we know that the internet has become central to our education, too, especially when it comes to research and collaboration with peers. The impact of the internet on education is not just changing the way we do schoolwork, though – it has also changed the way we interact with teachers and each other.

Education has changed dramatically in the last decade. With classrooms equipped with the latest technology, students are able to experience learning in new and exciting ways that they could never have before. It's not just the classroom environment that's changing; either; instructors and educators alike have to change their methods of teaching to match the new ways in which students prefer to learn.

With a reliable internet connection like Spectrum Internet, educators can take advantage of seamless connectivity and learn a great deal from all the resources that are available online. Technology has had an enormous impact on how we approach education in America, and that influence has only increased as the number of internet users grows larger every year. With online university classes, massive open online courses and even digital textbooks, many people wonder how these technological developments will affect the classroom experience.

Those who support the idea of assignments being done with the help of computers and online resources state three reasons why this is. Firstly, facts abound on the internet. The variety of resources by experts or eyewitnesses is unimaginable. From written texts to videos, online journals and books, to PowerPoint presentations, a student is sure to find information they would never have been able to if they were to simply pop round to the local library. This variety of sources makes learning more enjoyable and students will no doubt see the value of the work they do, which brings us to the second reason – interest in learning. While surfing the net to find information, links provide quick access to other related facts that might pique a student's interest and curiosity. For instance, if a student is doing research on the Victorian era as part of an assignment on Charles Dickens's novel *Oliver Twist*, they will click on links redirecting them to 19th century city life, boarding schools, the Industrial Revolution and the like. Through such links, they will not only learn about one aspect of a book or time period, but many. Finally, why would anyone be critical of the internet if the same research were done in a library? Instead of opening up a volume of the *Encyclopedia Britannica*, students would simply log onto the very same encyclopedia online.

The internet has had a profound impact on the way students communicate with each other. In the past, students would have to rely on phone calls or face-to-face

interactions to communicate with classmates. However, the internet has allowed students to connect with each other instantaneously, regardless of location.

This has made it easier for students to collaborate on projects and get help when needed. It drastically changed the way we access information and learn. In the past, if you wanted to learn about a specific topic, you would have to go to the library and hope they had a book on the subject. Now, with a few clicks, you can find thousands of articles, videos, and podcasts that cover any topic imaginable. This wealth of information is available 24/7 from anywhere with an internet connection, making it easier than ever to get an education. It has had a profound impact on education, providing new opportunities for learning and collaboration. One of the most significant changes is the ability to access visual aids that can help students had better understand complex topics. With a few clicks, students can find videos, infographics and other resources that can make learning more engaging and effective.

Note that ,one more positive aspect, which is worth being mentioned, is social skills development. Students can make projects with students from the other countries via email and chat rooms. It helps to meet new people from all over the world, to share interests and traditions. Thus, writing skills and virtual group communication skills can be developed. As it is observed, a lot of information at your fingertips for any topic that is possible to imagine, since with this great invention many barriers have been broken and it is enough to type what we are looking for and a click to display thousands of results offering data, from the most recent possible until written with years of antiquity.

As it is presented, the main advantage of the internet is communication. Through social networks, videoconferences, chats or specialized portals you can access debates, comments, opinions, photos, videos of other people and have a real-time communication. Whether for professional or personal purposes, the internet allows us to have better communication with people from all over the world. We can see that Online Education is definitely a good option for those who need to improve their academic level. Therefore, currently, educational systems are mostly using these benefits to support the teaching of their students and thus increase their motivation in learning content. On the other hand, platforms such as Wikipedia, Coursera, and Teachertube have also been opened, among others, which have dedicated themselves to imparting knowledge to people of all ages.

Overwhelmingly, It has also allowed us to take into account all the above, explore other cultures and ideologies that otherwise might have been impossible. Social networks play a very important role in this sense, since millions of people

gather in one place, regardless of language, country or distance. Another advantage of the internet is that it provides us entertainment. Songs, Movies, Games and other videos are available on the internet free. Likewise, if we want to be aware of the lives of our favorite celebrities, we can also do it with just a click on our mouse through digital magazines or news from the center.

According to the research, the internet does not only allow us to be in contact with our friends but also to search and request job offers through the communities and portals that exist for it. As we all know, there are chat rooms and social networks that help us find jobs. With the arrival of the Internet, new jobs have been created that previously did not exist related to the virtual world and the network.

Online Education is definitely a good option for those who need to improve their academic level. In addition, there are many advantages of online education that you can benefit from, for example, if you follow a distance-learning course. Some of the benefits of online education are listed below.

Advantages of the Internet in Education:

- **Low Cost:** Online studies cost less than any other learning program you only need a computer connected to the internet.
- **Schedule Flexibility:** You are the owner of your own schedule. Time is not a limitation in an online course.
- **Effective learning:** Teachers or instructors are available at convenient times for students and respond to inquiries quickly through email.

In online education, learning is focused on what you need. You can prioritize the things you want to learn according to your convenience.

In conclusion, the advantages and disadvantages of online learning underscore its transformative impact on education. The flexibility and accessibility it affords make it an invaluable tool for many, yet challenges such as social isolation and technical barriers should not be underestimated. Striking a balance between traditional and online learning methodologies is crucial to harness the benefits while addressing the drawbacks, ensuring a comprehensive and inclusive educational experience for all. O, these are the advantages and disadvantages of internet to our society. The new generations that were born in this era find it difficult to understand what the social dynamics were like before the internet. Because it is such a powerful tool. The internet offers many advantages that today generate different levels of comfort and access to goods and services. In addition, when its use is abused it can be detrimental to society. The use of the internet today is very useful but at the same time very harmful because it is increasingly generating carelessness and little effort to

the activities to be carried out daily. I would like to say that the future of education is impossible without the Internet. As far as I am concerned, the Internet helps me to study. I appreciate the opportunity to get an experience of learning online. To my mind, students of high school, colleges and universities should study online and it would be better for elementary school students to gain experience and knowledge off-line, at school.

From my point of view, educating students does not mean, “Teach the old and shun the new”. As technology advances with time, so must teachers adapt to it. Gathering information from a variety of sources has always been the bottom line and now that bottom line must come to include the internet as well. The Internet has been serving humankind for decades, and we have seen the many advantages it has given. However, it has been accused of things that are increasing its hazards day by day. No wonder the modern world is incomplete without the Internet. You cannot be sure for your children if leaving them unsupervised is OK. However, we have seen students from all disciplines seeing a clear difference in their academics before and after getting access to the Internet. No doubt, their performance will be much better when exposed to the Internet to attain knowledge. Online Education for Anyone Interested in Self-Development

Finally, the internet has enabled students to become learners that are more independent. Through the internet, students can access a variety of resources and tools to help them develop their skills and knowledge. This includes online courses, lectures, research materials, and more. Furthermore, the internet has enabled students to explore their interests and develop their own projects. This has enabled students to become more self-directed and to pursue their own learning objectives, helping them to become more confident and independent learners. In conclusion, when it comes to the internet in education, it has revolutionized the way we learn and teach. It has opened up a world of opportunities and made learning more accessible and efficient. With the internet, students can access a wide range of resources, communicate with peers, and explore their interests. Additionally, the mix of the internet and education has enabled distance learning and has enabled students to become learners that are more independent. Overall, the internet has numerous advantages in any education be it IT education or fine arts. In every other field, the internet has helped to enhance the educational experience for both students and teachers.

Abstract. This article attempts to highlight the issues of assimilation of various educational information in foreign language classes through the active use of infographics, as well as to consider the possibilities of open access services that greatly facilitate the teacher's preparation of infographics for the learning process.

Key words: infographics, teaching FL, critical and creative thinking, modern information technologies, visualization.

The modern education system is constantly striving to adapt to the multiplied volumes of information, high speed of interaction between society and information, seeing in the wide access to large amounts of data not only a significant advantage for the development of society and the individual, but also the need to develop and apply new ways of effective knowledge assimilation within the traditional lesson, taking into account the new realities.

A foreign language lesson has a certain specificity: on the one hand, students at all stages of learning have to assimilate a variety of information about the system of the target language, other countries, on the other hand, there is a parallel formation of key speech skills and the degree of success of this process largely depends on the level of knowledge assimilation in the required time.
